The Add Score Form Up Close

This form attribute tells the form to use a special type of encoding required for file uploading — it affects how the POST data is bundled and sent when the form is submitted.

Establishes a maximum file size for file uploads, in this case 32 KB (32,768 bytes).

This is a self-referencing form.

```
<form enctype="multipart/form-data" method="post" action="<?php echo $_SERVER['PHP_SELF']; ?>">
  <input type="hidden" name="MAX_FILE_SIZE" value="32768" />
  <label for="name">Name:</label>
  <input type="text" id="name" name="name" value="<?php if (!empty($name)) echo $name; ?>" />
  <br />
  <label for="score">Score:</label>
  <input type="text" id="score" name="score" value="<?php if (!empty($score)) echo $score; ?>" />
  <br />
  <label for="screenshot">Screen shot:</label>
  <input type="file" id="screenshot" name="screenshot" />
  <br />
  <input type="submit" value="Add" name="submit" />
</form>
```

The actual file input field, which ultimately relies on a native operating system dialog for file browsing and selection.

DONE

❷ **Change the Add Score form so that it uses a file input field to allow image file uploads.**
